

# Interaction Design and Children

Opening remarks:  
What is curiosity?  
(and how to assess it)

Jamie Jirout  
Rhodes College  
June 21, 2015

# Outline of talk

1. How can curiosity be assessed?
  - Why we need to assess it
  - The importance of an operational definition
    - Both for assessing and promoting
2. An example
3. Future directions/  
take-home messages

# Why study curiosity?

- Basic research and intervention studies: Does curiosity lead to learning? (better learning?)  
Do curiosity promoting interventions actually work?  
What is the impact of educational programs on children's curiosity?  
How can we design educational products that engage and promote children's curiosity?  
To improve educational practice and products

What IS curiosity?

# Children's curiosity: What is known?

- Literature review:
  - More than 350+ papers on curiosity in past 50 years!
  - A lot has been learned about curiosity, but...
    - Not much of it is generalizable or able to contribute to a single framework
    - No existing measure I could use!

# “Types” of curiosity definitions

Curiosity as spontaneous exploration	Any factor familiar (McRee, Martin)	Ignore important characteristics, children's they are exploring. (Murchin, 1971; Endsley, Hutcherson, Garner &)
Curiosity as exploratory preference	What character and/ Mar (Smock)	Organized from very general to very specific Important. Takes into account but not familiarity with or objects. Focus on <i>novelty preference</i> . (1964; Greene, 1964; Mendel, 1965)
Curiosity as preference for uncertainty	K under (Alberti and Moore, 1980; Arnone, Grabowski and Rynd, 1994; Vlietstra, Terrell, 1964; Charlesworth, 1964; Loewenstein, 1989; Schulz & Bonawit & Klahr, 2008)	as important as stimuli and the subject's <i>experience and</i>

# So what to do?

- Curiosity can be defined many ways, for different purposes.
- Research or design
  - Identify *purpose*, specify a definition of what you are interested, and *operationalize* it
  - Learning? Exploration? Question asking?  
Information seeking? Uncertainty reduction?
- Example: studying uncertainty preference

# Example of curiosity assessment

- Purpose: To create an assessment of curiosity
  - Look at individual differences
  - Assess change over time
  - Look at more general curiosity, rather than state-specific
- Operationalization:  
This was the tricky part!

# Example of curiosity assessment

## Information-Gap Theory: Loewenstein, 1994

- Curiosity is aroused when attention becomes focused on a gap in one's knowledge
- Adult studies show reliable pattern of an 'optimal level' of knowledge gap that leads to exploration
  - Too small or too great of a gap reduces likelihood of exploration

# Example of curiosity assessment

- The challenge: what to measure?
  - Curiosity as a stable, cognitive variable
    - BUT still sensitive enough to detect changes over time, for example from the beginning to the end of a school year.
- Operational definition
  - *The level of desired uncertainty in the environment that leads to exploratory behavior*

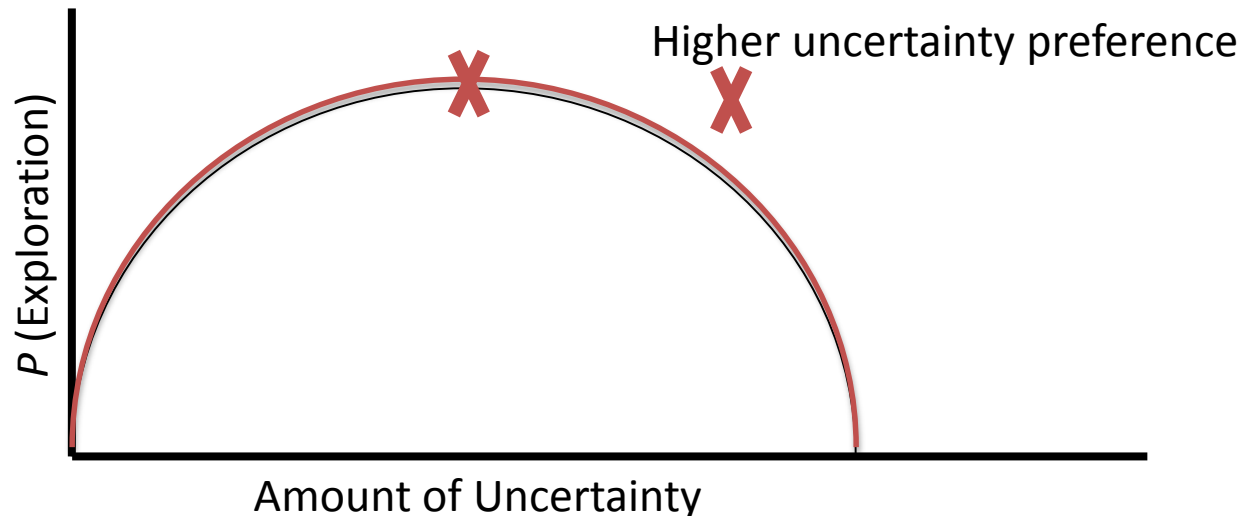

# Example of curiosity assessment

- Assess children's level of preferred uncertainty – when is a child *most likely* to explore?
  - In a situation with two choices to explore, differing only in amount of uncertainty, which will a child choose?

# Example of curiosity assessment

- Assess children's level of preferred uncertainty – when is a child *most likely* to explore?
  - In a situation with two choices to explore, differing only in amount of uncertainty, which will a child choose?

# Measuring uncertainty preference

- Assess children's level of preferred uncertainty – when is a child *most likely* to explore?

None vs. Medium

None vs. Maximum

Medium vs. Maximum

# How does technology help?

- Technology = control!
  - Less errors
  - Adaptive measures
  - Fun stimuli
  - unlimited exploration, ability to create and imagine

# Underwater Exploration!

*“On this turn, look at the sides of the screen to see what fish might be outside of each of the windows. Now tell me, which one of the windows would you like to open?”*

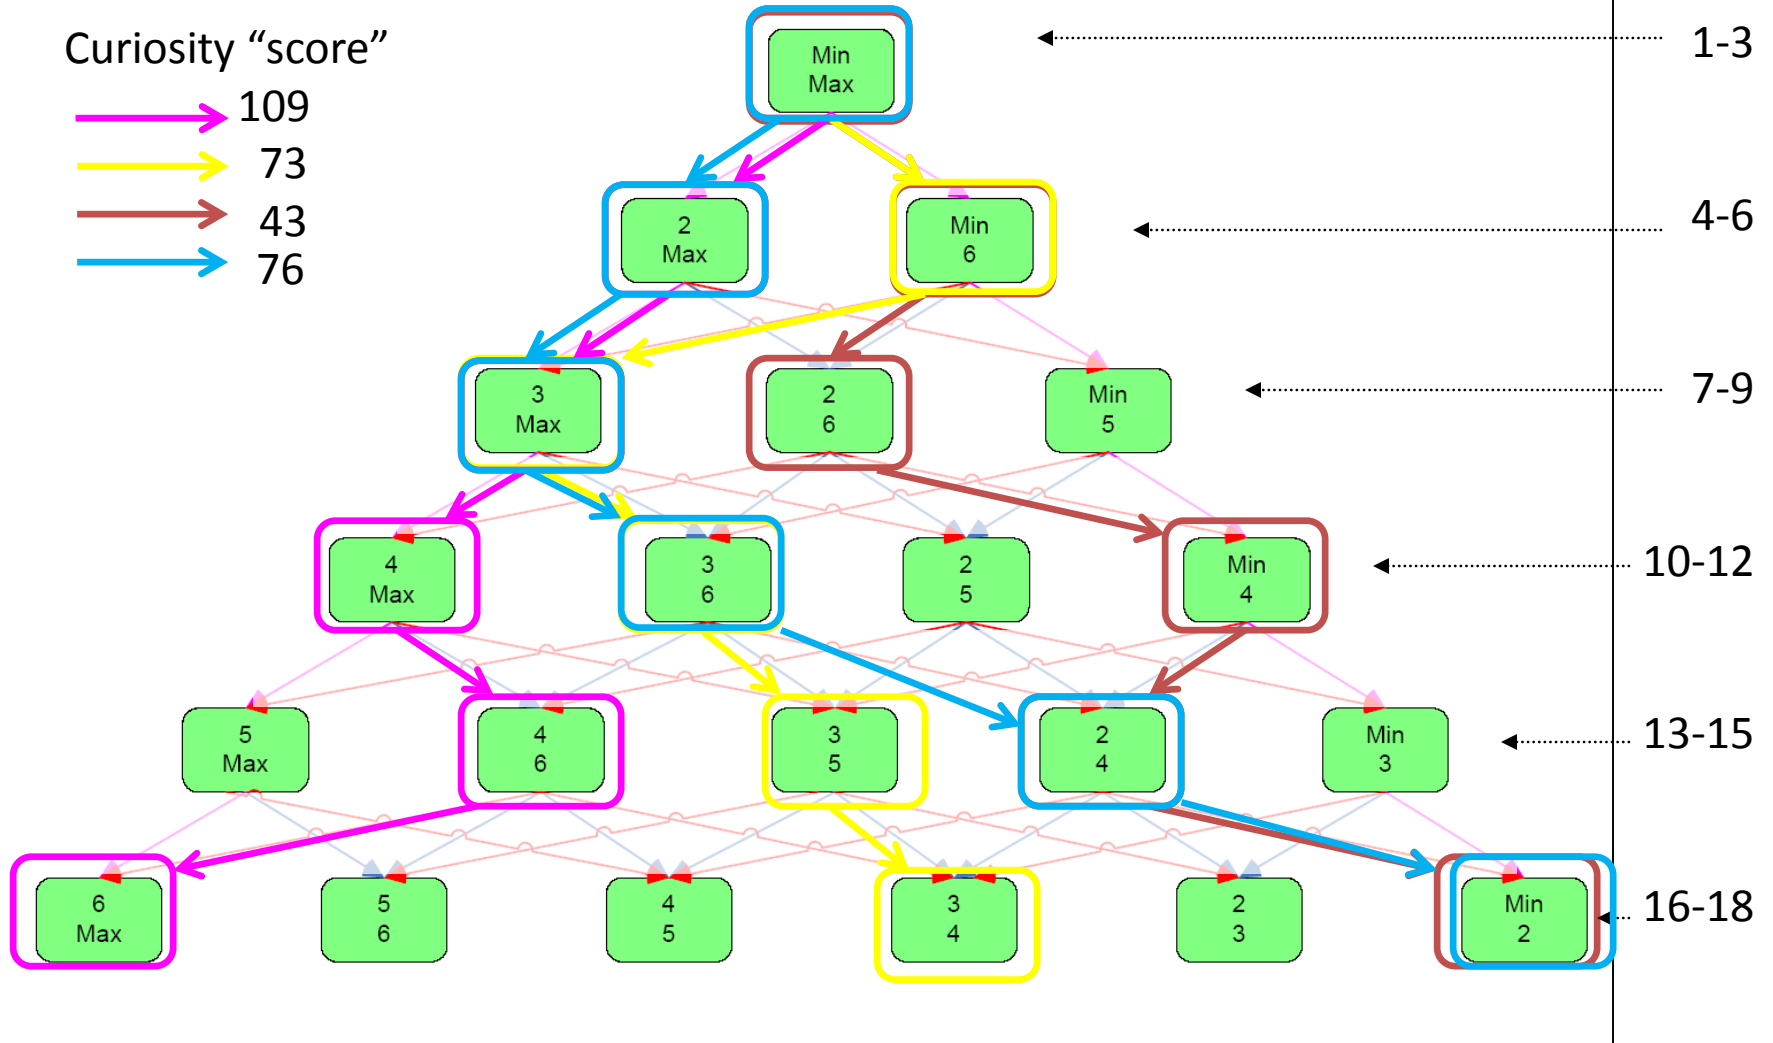

# Underwater Exploration!

Trials:

Curiosity "score"

- 109
- 73
- 43
- 76

# Yay, a measure!

- What next?
  - Can answer research questions
    - Does uncertainty preference relate to other types of exploratory/curiosity behaviors?
      - Persistence/attention, competence motivation, question asking, recognizing effective methods of reducing uncertainty: yes!
      - Manipulating an object to learn about it, exploring a science museum exhibit: not always.
    - Does it relate to learning?
      - Some evidence suggests yes!

# Yay, a measure!

- What next?
  - Can answer research questions
    - How can the research results be used to inform practice and design?
      - Looking at curiosity *this specific way*: provides suggestions for increasing *state* curiosity by providing optimal uncertainty
      - Provides theory of how to increase curiosity
    - Can kids learn to feel comfortable with *more* uncertainty?
      - Stay tuned 😊

# However...

- My measure is just an example
  - Very specific “type” of curiosity
  - Was designed for a specific purpose
- Much more work needed!
  - Including more measures
  - measurement methods

# Main Message:

- To move the field of curiosity research forward: It's less important *how* you define curiosity, just that you *do*
  - And that you pay attention to others' operationalizations as well
- Technology provides us experimental control and (more importantly) an incredible space to create opportunity for children to explore and learn
  - Can be utilized to both assess and promote curiosity
- By understanding the processes or constructs identified as “curiosity”, research findings can be utilized in technological design

Thanks!
